## AN-4TK400 400VA Toroidal Transformers

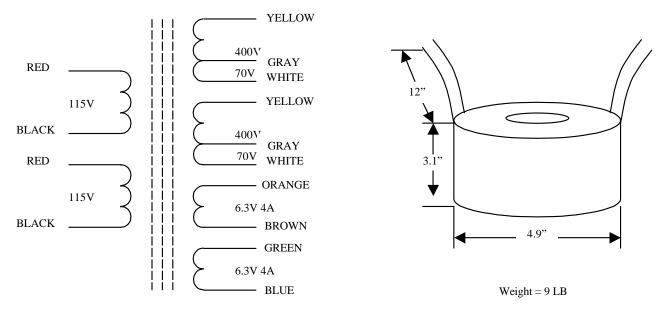

The 400VA toroidal transformers are commonly used in the high-end tube audio amplifier and guitar amplifier. This toroidal transformer has a very low magnetic leak. They are specially designed to work on all standard 115V or 230V at 50Hz or 60Hz. These transformers have heavier gauge wires then the normal requirement to avoid the copper lost during the full power output. The dielectric test is more than 3500V in between primary and secondary coils. Please see the test data for short circuit and open circuit.

In most of the cases, this transformer can be output 20% more power from its rating at 60Hz power source without any problem. This transformer comes with 2 rubber pads and all mounting hardware.

Open Circuit Test (core loss test):	Voltage input	Current	nt input Power lost		
TEST CONDITION: Apply variable voltage to primary coils (in parallel). Set voltages 120 and 140VAC at 60Hz. No load on secondary coils. Measure the primary current and input power.	120V 140V	.04 .09		4W 7W	
Short Circuit Test (copper loss test):	Voltage input	Curren	t rated	Power lost	
TEST CONDITION: Short all secondary coils, and apply variable voltage to (parallel) primary coils. Varies the voltage from 0-20VAC at 60Hz and freeze the voltage at rated primary current.	6.3V	3.45A		21W	
Load Test (operation test):		Current output		Power output	
TEST CONDITION: Input 120VAC 60Hz to the primary coils (in parallel), Output 1 and 2 in parallel to load, and measure voltage and current at different load levels.	405V 375V	0.0A 1.3A		0W 476W	
DC Resistant Test:	Primary S		Sec	Secondary	
DC OHM METER: Test primary and secondary coils (value for each coil).	1.9 oh	ohm		28 ohm
